INTRODUCTION

India is mainly agricultural country several festivals relate to agriculture in India like Holi, Sankranti etc. Agriculture is the most important occupation for most of the Indian families. In India, agriculture contributes about sixteen percent of total GDP and ten percent of total exports. Over sixty percent of India's land are arable making it the second largest country in terms of total arable land, agricultural products of significant economic value include rice, wheat, potato, tomato, onion, mangoes, sugarcane, beans, cotton etc. Agriculture is the back bone of Indian economy through, with the growth of other sectors the overall shares of agriculture on GDP of the country has declining with the countries broad based economic growth. Still agriculture is demographically the broadest economic sector and plays a significant role in the overall socio- economic fabric of India.

Agriculture is a critical sector of the Indian economy. More than half of the India's population still relies on agriculture as it is the principal source of their income and an important source of raw material for a large number of industries. The agriculture sector has been playing a vital role in reducing rural as well as aggregate poverty, socioeconomic advancement and sustainable economic development through the gradual improvement of the rural economy. Whenever agriculture and food grains are talked about, rice comes first in mind. Rice is the most important food in many parts of the world including India. More than half of the Indian population depends on rice for food calories and protein. Wheat is the second most important cereal in India after rice. Wheat crop contributes substantially to the national food security by providing more than 50 percent of the calories to the people who consume wheat as their staple food. Sugarcane is the major sugar producing crop. India is the second largest producer of sugarcane after Brazil. Mustard is the second most important edible oilseed crop in India after groundnut and accounts for nearly 30 per cent of the total oilseeds produced in the country. However, as is the case in many countries, the gaps between yields obtained at research stations and farmers' fields still exist in India. Narrowing of these gaps could improve not only the productivity, but also the efficiency of the major crops. There is hardly any scope for expansion of the area under these crops.
